ADMIXTURE BATCHING SYSTEMS
ME995 Batch Controllers with AMM, CMM or MM Magflows

Congratulations on choosing a ManuFlo® (Manu Electronics) preset batch control system. You will now join many thousands of satisfied customers worldwide.

Your system comprises:

Information sheets included:
1. ME995 preset Batch Controller specification and options.
2. Basic electrical wiring guide.
4. Troubleshooting guide.
5. Service adjustment guide (specs).
6. Flowmeter brochure spec (chosen flowmeter AMM, CMM).
7. (if ordered) PLC/computer interface spec brochure.

Prior to installation:
A. Consider a good viewing AND operating position for the ME995 Batch Controller. The controller is a panel mount design so mount into the cutout in your control panel or mount into the ManuFlo housing enclosure.

B. Remove the detachable 10-pin plug from the rear of the ManuFlo controller. Wire the 240VAC supply (or DC powered as optionally ordered). Wire the Active/contact drive, Neutral and Earth from the solenoid valve or return from the external contactor if driving a pump. If starting a pump, make sure the contactor is of sufficient amperage rating to handle the pump current draw. Consider wiring an override button (N.O. with spring return) for manual batching or top up of admix, which will be counted by the controller display. See wiring diagram.

C. Install the flowmeter as per the installation guide found on the flowmeter brochure. (For AMM/CMM magflows make sure the fluid to be measured has a conductivity of more than 50μs per cm.)

D. Use shielded cable only for connection between flowmeter and Batch Controller. AMM flowmeters are supplied +12vdc from the batch controllers, CMM or MM flowmeters require 24vdc, so use a 12-24vdc step-up converter or use a separate 24vdc supply.

E. The ME995 Models -1 thru to -6 Batch Controllers have fixed calibration of 1ml/1p and can be used with AMM15, AMM20, MM10 1000ppl flowmeters. ME995 (-7, -7D, -7DS prefix) models can be used with AMM25, CMM20, CMM25, MM20-25 flowmeters, the calibration is variable via K-factor to allow use. Batch Controller will be factory set on the K-factor calibration number corresponding to the flowmeter selected. A calibration check must be performed prior to continuous use and commissioning of the system (see installation guide).

If unsure on any aspect of installation or operation, call ManuFlo or your local installer.

Happy batching !!!!!!!!!!!!!

Consult your local systems integrator / admix supplier or ManuFlo for advise.
ManuFlo recommends all non-manuflo equipment be sourced locally if possible (e.g. Valves, hoses, solenoids, pipe fittings etc). (or go visit a batch plant Install and see ManuFlo equipment in operation)

ADMIXTURE SYSTEM INSTALL PROCEDURE

- Simply mount the batch controllers with the wired housing boxes in the batch hut.
- Mount the pumps on the stand with the flowmeters and fittings. Wire as per wiring diagrams.
- Protect all external 240vac power cables with channel conduit to protect from electrocution.
- Run the low voltage 12vdc or 24vdc signal cable from the flowmeters up to the rear of batch controller inputs.

ADMIXTURE SYSTEM INSTALL PROCEDURE

- Simply mount the batch controllers with the wired housing boxes in the batch hut.
- Mount the pumps on the stand with the flowmeters and fittings. Wire as per wiring diagrams.
- Protect all external 240vac power cables with channel conduit to protect from electrocution.
- Run the low voltage 12vdc or 24vdc signal cable from the flowmeters up to the rear of batch controller inputs.

Other suggested pump options - Onga 400 (CF) 413-417 series centrifugal pump options:
- Mono Pumps 240vac CF25 @30LPM, CF80 @80LPM, CF100 @120LPM, I/O 1 to 1 ½ BSP-f
- Onga Pumps 240vac JS110 @45LPM, JS120 @60LPM, I/O 1 ¼ to 1 ½ BSP-f threaded connections.

Stats: 10mtrs/H. Self-priming to 6 metres up to 25 metres head. (specs with water)
Ideal for higher S.G. chemicals and faster flow delivery requirements.

USE RE-INFORCED HOSE LINES for Admixture Install.

General Pump application use info: Centrifugal (CF) Pumps general use for typical chemical admixtures. Positive Displacement (PD) Pumps ideal for dispensing higher S.G. liquids Delivering faster flowrates and head heights. These pumps generate higher pressures so ManuFlo recommends a recirculation pressure relief flow line be installed. Refer to our technical guides.

WIRING DIAGRAM: ME995 Batch Controller and Computer Batching System.
(1) Locate the most appropriate position to mount the magnetic flowmeter. Preferably:
- your site’s flowmeters should be grouped together off the ground on a stand.
- protect the flowmeters from the elements by using a cover, which should be lightweight with handles for easy access by service personnel.
- To avoid any stray signal pulses a vibration free area is recommended. Refer to the relevant magnetic flowmeter datasheet for more detail (refer to the “Installation” section in the AMM, CMM, KMS product brochure).

(2) Establish the outlet point position in relation to the storage tank:

2a) If the outlet point is above the top of the storage tank (the most commonly used setup), then the additional equipment you will need is at least: a pump, non-return valves or spring loaded check valves (12psi), flow restriction gate or ball valve and, optionally:
- a solenoid valve (air-assisted ball valve type) for instant shut off of flow, recommended to prevent the Venturi effect when injecting into water lines, but is not required if installation has reasonable head height and dispensing directly into mix.
- a 3-Way Valve to provide an easily accessible calibration point.
- ¾” to 1” pipeline or rigid hose.

2b) If the outlet point is at the same level as the storage tank, then the equipment you will need is at least: a pump, a flow restriction gate or ball valve, a flowmeter with pulse output, and a solenoid valve to stop free flow.

2c) If the outlet point is below the level of the storage tank, then the equipment you will need is at least: a flow control solenoid valve, a flow restriction gate or ball valve, and a flowmeter with pulse output.
**SELECTION OF PIPE LINE DIAMETERS** (for AMM15/20 20mm, CMM25, MM 25mm flowmeters)

► For low flowrates and small batch quantities of liquid (approx < 2000mls), use ½” diameter pipe or hose (after the flowmeter). ►

For medium to high flowrates, use ¾” to 1” diameter pipe. ► For very high flowrates, use 1¼”.

**NOTE:** Pipeline can be flexible reinforced hose (NOT flexible expandable soft hose), rigid PVC or metallic.

**PUMP SELECTION**

► When measuring fluids of specific gravity 1 - 1.25, then use centrifuge pumps of 0.5 - 1 horse power (e.g. 1” Onga 413 or Davey pumps. When using larger capacity flowmeters, a proportionally larger pump will apply). A flowrate upto 0.8 Litres per second can be achieved, depending on head height. ► For higher density fluids, positive displacement (PD) pumps are more suitable. Because of pressures generated by PD pumps, it is important to be able to restrict/regulate the flow and also relieve pressures—this can be achieved by using an inlet-to-outlet bypass flow valve to recirculate the flow line.

**No FILTERS required. But Pipe lengths.**

Not required with magnetic flowmeters as no moving parts. But allow 5 x dia. on inlet side and 3 x dia. on outlet of magflow of straight pipe of same diameter or larger of the flowmeter bore to flow condition straightening.

**COMMISSIONING BATCH CONTROL SYSTEMS**

- Determine the most appropriate position to mount the Batch Controller so it will be clearly visible to the operator and within easy reach.
- Mount the Controller either in a panel cutout or in a standalone ManuFlo housing box.
- Electricians must refer to the relevant ManuFlo wiring diagram (supplied with the Controller). Ensure that there is no power to the Controller before connecting the flowmeter signal cable into the 10pin Weidmuller plug. When wiring the flowmeter, use 2-core shielded cable (use more cores if wiring more flowmeters) - this will supply the flowmeter(s) with 12VDC from the Batch Controller, and will transmit pulses from the flowmeter to the Batch Controller: 1 wire for pulse, 1 wire for +12 volts, and the shield as 0 volts return (For AMM electromagnetic flowmeters, use the +12 volts to power the units, for CMM & MM magflows which require 24vdc use the +12-24vdc power converters to power the units from the batch controllers).
- Connect the applicable power supply voltage to the controller(s). For pump applications, a heavy duty contactor (10 Amps for e.g. Onga413 centrifuge pump) must be wired into the system. Contactors can be supplied by ManuFlo. Do not use plug-in relays.
- Power up the system. Reset and start a number of times to prime the system, until fluid appears at the outlet line and the Batch Controller digits begin counting.

**A volumetric calibration test should be performed when commissioning a new installation: place a calibrated vessel at the discharge point, set a batch quantity on the ManuFlo Batch Controller, batch the quantity and then check that the delivered quantity is what was requested. A calibration check should also be performed periodically (say every 3-6 months):**

- on the Batch Controller, select an amount of liquid e.g. 1000 mls. Then press Reset, then Start.
- at the calibrated container, check that the amount dispensed is as requested (e.g. 1000 millilitres).
- An overflow may occur due to the inability of the pump to stop instantly. The amount of overflow will depend on how fast the liquid is being dispensed and/or the closing time of the solenoid valve. The Batch Controller will count the overflow as part of the displayed total dispensed.
  - if the system is totally controlled via PLC/Computer, overflow will be adjusted by the computer; otherwise,
  - where a ME995 series Batch Controller is fitted with a Preact, simply set the Preact to the amount of overflow i.e overflow = (actual amount dispensed, as shown on the Batch Controller display) minus (amount requested).
- If required, slow down flow velocity by using a restriction gate valve, or install a quick-acting solenoid valve.
- **Note:** If the flow is restricted excessively, the Batch Controller Pulse Fail circuitry will shut down the system for safety reasons, in which case open up the restriction gate valve.

**For safety,** when using ManuFlo Batch Controllers in a system controlled by a PLC/Computer with batch recipe software: **on the Batch Controller use the front selector switches to set the maximum batch limit and/or doserate.** Thereafter, in the event of a flowmeter or PLC malfunction, the Batch Controller will override the computer and stop the batch.

If unsure about any aspect of installation, please check the appropriate wiring diagram, product brochure and trouble shooting guide.
### FEATURES

- LED displays
- 4 x LED diagnostic indicators
- Preact/freefall function
- Preset maximum limit
- Missing pulse detection
- User friendly simple operation
- Optional PLC/computer interface
- & pulse/setpoint/alarm outputs
- Many configuration options

The ME995-series panel mount preset batch controllers are available in a range of configuration options. They are suitable for use with pulse output flowmeters for preset liquid batch control applications.

Using rotary selector switches, batch quantities are quickly and easily selected. The batch operator can cross-reference the up-count LED display counter with the originally selected batch quantity shown on the selector dials. The final batched quantity is displayed on the LED batch screen. Command operations are performed by toggle switches, and four LEDs indicate operational status conditions.

The controller incorporates a standard pre-act (overflow deduct) feature, K-factor adjustment (-7 series models only), 4 diagnostic status condition LED indicators. All wiring and output options are via plug sets, making replacement or maintenance a simple procedure, without having to rewire the installation. The ME995 is easily interfaced with PLCs, thus incorporating the controller's safety features and providing a set-point system with a backup batch facility.

Standard controllers are in panel mount form, with 240vac input supply, 240vac output drive, and 12vdc to flowmeter.

A range of enclosures are available, in metal or ABS, rated to IP65.

#### OTHER OPTIONS

- MC2  PLC interface, Start/Stop/Reset volt free commands via 4pin & open collector pulse via 2pin (For Batch Controllers interfaced in a Computer/PLC controlled batch plant)
- 5P, with ME5IC PLC interface via plug and special isolation command card (for USA based computer systems)
- S12 Two product control selection switch, sequential relay output drives, (2pump/valves/flowmeters)
- AO Logic or relay output on batch complete or alarm condition
- 110V  110vac Supply & control voltage
- DC-OC  12-24 VDC power supply input / output drive, with Open Contact output drive (5 Amps) which is via external voltages e.g. 12 or 24 VDC, 110 or 240vac
- 24VAC-OC  24 vac power supply input / output drive (Neutral can be to Ground or floating)
- 110-OC  110 vac power supply input / output drive
- OC-DC  240vac supply, Open Contact output drive (5 Amps), Drive is via external voltages e.g. 12 or 24 VDC, 110 or 240Vac
- 12-24C  +12 to 24vdc power converter step-up module for CMM mag flowmeters

#### HOUSING ENCLOSURES

- SHB Single Metal powder coated enclosure
- SHB1 Single box, wired with 240vac contactor (for 1 hp pump), plug-in 240vac pump outlet, and plug
- DHB Dual Metal powder coated enclosure
- DHB2 Dual box, wired with 2x 240vac contactors, 2x pump outlets, and 2x plugs for Batch Controllers.
- T Terminal strip connection fitted in SHB1/DHB2 boxes for power/pump drives in lieu of GPO
- HB2510 IP66 ABS waterproof clear swing lid enclosure –SS316-hinges
- SSR External commands start/stop/reset IP65 rated (fitted to HB2510)
SAFETY FEATURES
* LIMIT (LM) LED activates if batch cycle reaches locked internal limit, or if circuit diagnostics detect internal chip problem. Subsequently, there is automatic shutoff of voltage contact drive.
* PULSE FAIL (PF) LED activates if no pulses arrive within 1.5 seconds (variable) initial start time period, or if pulses are interrupted during batch cycle and fall below (variable) pulse scanning time (typical 30Hz). Subsequently, there is automatic shutoff of voltage contact drive.
* FLOW (FL) LED monitors and indicates incoming pulses from field flowmeter, or if TEST is used.
* CONTACT DRIVE (CD) LED indicates voltage contact output drive when pump or solenoid is activated.
* ALARM sounds momentarily upon batch cycle completion, and continuously if PULSE FAIL or LIMIT LEDs activate or if overflow setting is reached.

OPERATING INSTRUCTIONS
* Switch ON the power to unit. Select required batch quantity using rotary number dial selector switches.
* RESET the unit. The LED displays zeroes, and all LED indicators and any alarms turn off. The unit is now ready for batching.
* To operate, push each of the toggle switches ON-OFF, START-STOP and TEST-RESET to the desired function.
* START unit - this activates the voltage contact drive. CONTACT DRIVE LED illuminates indicating pump or solenoid is energized, followed by FLOW LED illuminating, indicating pulsing and operation of flowmeter. The LED digits begin counting upward towards the selected batch quantity.
* Upon the LED digits reaching the selected batch quantity, the alarm sounds (short beep) indicating completion of batch, CONTACT DRIVE and FLOW LEDs turn off. The LED display digits and selected batch quantity should correspond. If LED digits overshoot target, use PREACT (inflight, freefall) overflow deduct dials (located at the rear of controller unit) to scale back the difference.
* To interrupt before completion of batch, push the STOP toggle - counting will stop, and drive contact will go off. Push START toggle to resume or complete batch cycle.
* TEST toggle is used to test digit counting, switch contacts, alarm conditions or generate output pulses for computer interfacing tests. TEST does not activate the pump or solenoid.

SPECIFICATIONS
Power supply  220-260 vac (optional 24vac, 110vac or 12-24 VDC)
Output to flowmeter  12 VDC up to 100mA
Relay outputs  Max. 240 vac, 30 VDC  1 Amp.
(or open contact drive where ordered)
Frequency input  5 KHz: x1 input, or 340 Hz: x17 inputs
Displays  7 segment LED (14mm H), (Qty 2-5, depends on model).
4x 3mm LED status indicators
Connection  10-pin Weidmuller mating plug and socket
Fuse  1 Amp (5 x 20mm case)
Batch selection  Visual rotary select switches
Batch commands  Push toggle switches
Instrument housing  ABS hi-impact case
Mounting  Panel mount
External dimensions  206 L, 130 H, 90 D mm
Panel cutout  190 L, 122 H mm
Weight  1 kg

Due to continuous product improvement, specifications are subject to change without notice.

Rev: 05/20
**FEATURES**

- Very compact and lightweight design in sizes 15mm (½”), 20mm (¾”) & 25mm (1”).
- 1000 pulses/Litre (15, 20mm sizes), 500 pulses/Litre (25mm size).
- 15 and 20mm models are directly interchangeable with MES20 20mm flowmeters.
- Measurement range 0.2 to 10 m/s @ +/- 2%.
- PVDF lined sensor, Stainless Steel 316 electrodes with integrated grounding rings.
- BSP(male) threaded end connections. Supplied with BSP (female) couplings.
- Virtually maintenance free, with no moving parts.
- Measures liquids with conductivity > 20μS/cm, to 40°C.
- Accuracy is unaffected by varying viscosity or specific gravity of liquids.
- 12 VDC powered (can be directly powered from ManuFlo devices, has LEDs for pulse and power indication (optional 24 VDC for use directly with 24V PLCs).
- Easy plug-in wiring connections via DIN43650-A plug set to IP65 rating.

**INTRODUCTION**

The Admix Mini Mag is a low-cost Electromagnetic Flowmeter designed for the economical measurement of chemical liquid admixtures and any other conductive liquid. The 15 and 20mm sizes output 1000 pulses per Litre (1 pulse / 1 ml), making them a direct replacement option for MES20 admixture flowmeters in applications where there is a high content of solids in the measured liquid. Liquids with an electrical conductivity of at least 20μS/cm can be measured. The processor/electronics is integrated with the flowmeter sensor, so these two elements form a very compact package.

The Admix Mini Mag is available in three sizes: 15, 20 and 25mm connections i.e. ½”, ¾”, 1” with 8mm, 12mm and 20mm bores respectively. With no moving parts, and an obstruction-free bore, this type of flowmeter is ideal for measuring a wide range of liquids up to a temperature of 40°C, with no head losses and virtually no ongoing maintenance. The Admix Mini Mag is ideal for measurement of admixtures in concrete batch plants, flowrate and total and general process batching applications.

Admix Mini Mag is powered by +12VDC supply, and can be used directly with the complete range of ManuFlo or any other instrumentation e.g. ManuFlo ME995 and ME3000 Batch Controllers, ME2008 and UIC interface boards, FRT303 and MES indicators.

The operation of electromagnetic flow meters is based on Faraday’s Law of Induction. A voltage is induced in a conductor as it moves through a magnetic field. This principle is applied in the Admix Mini Mag design. The voltage induced in the flowing liquid, is measured at two electrodes & is proportional to average flow velocity. The microprocessor then scales this signal voltage to read in digital units.

**ELECTRICAL CONNECTIONS**

**Electrical Connection**
DIN 43650 plug set

To wire: Use minimum 2 core shielded cable. Unscrew the DIN female plug, remove the gland, pass the signal/power cable through the gland and connect as per diagram to designated pins. Tighten the gland and then refit DIN plug, tighten screw to assure a secure seal to IP65 rating.

**CONNECTION**

Caution: Never use the instrument without a load resistance. Check the load resistance “R” before connecting the power.

**Note:** All ManuFlo devices (e.g. ME995, ME2008, UIC, FRT) have an inbuilt pull-up resistor so R is not required/applicable.

**INSTALLATION & CONDITIONS OF USE**

- It is essential that the meter tube be always completely filled with liquid.
- Partial filling, or an empty pipe, will result in pulse fluctuations from 1 – 900Hz. Keep the pipe full at all times.
- The flowmeter will transmit pulses in the forward flow direction only. Reverse flow (backflow) will not be measured.
- The installation orientation is arbitrary. The flowmeter should not be installed in the vicinity of strong electromagnetic fields.
- Valves or other shutoff devices should not be installed immediate to the flowmeter. Allow some straight pipe before and after the flowmeter (length upstream: 5x diameter, length downstream: 3x diameter) before fitting elbows, valves etc.
- For accurate measurement, the diameter difference of the transition from the pipeline to the flowmeter should be kept to a minimum.
- Flowmeter has inbuilt Stainless Steel grounding rings.
- Fluid temperature range of –10 to +40 °C. Pressure up to 10bar @20°C. Conductivity of fluid must be > 20 μS/cm.
- After prolonged period of use, if the calibration is found to be significantly inaccurate then the flowmeter probes may be excessively coated, so remove and wipe the inside of the flowmeter tube. The flowmeter is rated to IP65, but as a safeguard after installation, place a cover over the flowmeter and make sure signal cable is looped downward to avoid trailing water ingress through cable gland.
- **WARNING:** Do not exceed the maximum recommended flowrate as overdose will occur. (Generally the correct size flowmeter for the flowrate should be selected to avoid this). Flowmeter will measure below minimum flowrate but at a reduced accuracy (e.g. ±10%).

**Flow Measurement & Control Products**

*Rev. 2019*

Due to continuous product development, specifications are subject to change without notice
FEATURES:

- Very compact, light weight design.
- Sizes 15mm (½”), 20mm (¾”) & 25mm (1”).
- High resolution Pulse output signal.
- 1000 PPL (15mm), 500 PPL (20mm), 100 PPL (25mm size).
- Full scale Accuracy ± 1.5%, ±0.3% of rate, 1% repeatability.
- PEEK sensor tube, Stainless Steel 316 electrodes
- BSP (M) threaded end connections.
- Electrical connection via M12 Plug and socket set.
- Virtually maintenance free, with no moving parts.
- Measures liquids with conductivity > 50μS/cm.
- Process temperature to 90°C, pressure to 1600 kPa.
- Accuracy is unaffected by varying viscosity or specific gravity of liquids.
- No moving parts, nothing to block.

INTRODUCTION:

The CMM Mini-Mag is a low-cost compact Electromagnetic Flowmeter, suitable for industrial applications for flowrate and totaliser liquid metering and batching.

Liquids with an electrical conductivity of at least 50μS/cm can be measured. The converter/processor is inbuilt on the flowmeter sensor primary. These two elements form a very compact package.

With no moving parts and an obstruction-free bore, this type of flowmeter is ideal for measuring a wide range of conductive liquids (that are chemically aggressive, or dirty) up to a temperature of 90 °C, with minimal head losses and virtually no ongoing maintenance. CMM Mini-Mag is ideal for measurement of recycle water or water based liquids including admixtures with impurities, providing flowrate or total display for shotcrete and for process batching/monitoring applications. The MiniMag can be used in conjunction with a remote ManuFlo FRT-303 Indicator, ME4-T reset counter, ME-series Batch Controllers, ME2008 batch interface cards, UIC scaler cards or can be connected to 3rd party PLCs via the onboard pulse output.

PRINCIPLE OF OPERATION:

The operation of electromagnetic flow meters is based on Faraday’s Law of Induction. A voltage is induced in a conductor as it moves through a magnetic field. This principle is applied in the Mini-Mag design. The voltage induced in the flowing liquid is measured at two electrodes, and is proportional to the average flow velocity. The microprocessor then scales this signal voltage to read in digital units.

**WIRING WITH ME995:**

As the CMM mags require +24VDC power, use the Part no: CV12-24VDC step-up power converter. Connect from the +12VDC of the batch controller to input of converter, output of converter wires to + supply of magflow. See diagram below:-
### Batch Controllers – Troubleshooting

</tbody>
</table>

---

**Flowrate lower than average speeds**: Pipes hoses are clogged. Clogged near SOK — pump has rubbish in the centrifuge rotor — clean out pump — gate valve seized — rubbish jammed in non return valve — suction side of pump issues -- piping blockages etc. change to PD pump -- close bypass valve if installed to increase pressure of flowrate

**NOTE:** In winter, liquid may flow slower causing Pulse Fail. We recommend:
- Opening up the restriction valve. **OR**
- Fitting the capacitor to change Batch Controller T1 timing
Sequential fault finding and rectification

1. If a another Manu controller (any model) is available, simply unplug doubtfull unit and plug in exchange unit. If the new unit is also not operating correctly, then the problem is isolated to the pulse flowmeter or wiring.

2. When checking flowmeter, reset the Manu controller. Check the flowmeter has the correct voltage supply. Remove the flowmeter from the flowline and clean out the inner tube passing a cloth thru it. Re-install and run the system. If still no counts the pulse cable may be broken or junction wire connection area, replace it. Run the system Check the Manu controller - it should have registered a number of counts on the display. If no counts are registered, replace the flowmeter. (Manu controller should be switched off when connecting new flowmeter).

System overbatch problem

1. The selector knob number dials on the Manu preset batch controller may not be positioned correctly, and therefore do not correspond to the rotary switch numeric values.

2. To test, set all numbered dials to the zero position, then press the RESET toggle - the alarm should beep momentarily. This will indicate correct alignment of dials. If alarm does not beep, this indicates incorrect alignment of number dials. To rectify, remove the grey-colored cap from dial, unscrew knob and pull knob off. Now check that the exposed switch shafts (black) flat side are horizontal. If not, turnshafts horizontal and refl the numbered dial knob to the zero number setting. For dosage switches, position to zero and push the TEST button. Digits should not count (except in the ME995-3 model). If digits count, then remove grey knob and check as described in 1.

3. If batch controller is tested and found to be operating correctly, then proceed to checking and testing flowmeter components.

SERVICE ADJUSTMENTS - to safety timings and limits for ME995 - ME188 preset batch controllers.

INITIAL START (T2):
Once start toggle is pressed, controller allows a standard 1.5 seconds for pulses to arrive from the flowmeter. If there are no pulses within the 1.5 second time period, the controller will shut down the output voltage drive, and will tuen on the pulse fail LED and alarm warnings. In some applications, the 1.5 second delay may not be long enough, due to slow opening solenoids or slow pressure buildup pumps etc. The initial start time period can be increased by soldering a tantalum capacitor in parallel with the standard capacitor value, found on the rear of the Printed Circuit Board (PCB). See Table 1 and diagram below, for capacitor values and location on PCB.

FLOWRATE (T1): If pulses do arrive within the allocated initial start time, the controller then locks in pulserate safety. Most Manu batch controllers have a standard 30 counts per second (30Hz) pulserate safety setting. If the pulses from the flowmeter drop below the 30Hz, the controller will shut down the output voltage drive, and turn on the Pulse Fail LED and alarm warnings. The 30Hz standard setting is typical with concrete admixture dispensing systems using MES20 (1ml/1 pulse) flowmeters, where if the flowrate drops below 30 milliliterse per second the pulse fail safety will activate. The flowrate (frequency) minimum setting can be adjusted by soldering a capacitor in parallel with the standard capacitor found on the PCB. See Table 2 and diagram below, for capacitor values and location on PCB.

Note: The flowrate safety timing is changed if required by very low flowrate applications, or when using flowmeters other than the most commonly used (MES20, AMM15/20, CMM15, 1 pulse/1ml output flowmeter, CMM25 100ppl). When controller/flowmeter systems are ordered, we supply the safety timing setting to suit your chosen flowmeter, thus always providing the safest possible watchdog system.

LIMIT (LM): The maximum permissible batch limit is determined by the factory-set internal limit value. The factory setting is always at the maximum value. But the limit setting can be reduced by simply desoldering the limit lead wire (connected to the rear of the rotary switch solder pads) and resoldering to set the desired quantity (see diagram below)

Standard factory set values are T2: 1µF capacitor, T1: 0.02 µF capacitor. Use the following tables to change factory set values.

Table 1. INITIAL START TIMING (T2)

<table>

Batch Controller Calibration Test

Volumetric Calibration Test should be performed when commissioning installation

- place a calibrated vessel at the discharge point
- on the Batch Controller, select an amount of liquid e.g. 1000 ml
- press Reset, then Start to batch the quantity
- at the calibrated container, check that the amount dispensed is as requested.

An overflow may occur due to the inability of the pump to stop instantly. The amount of overflow will depend on how fast the liquid is being dispensed and/or the closing time of the solenoid valve. The Batch Controller will count the overflow as part of the displayed total dispensed.

- if the system is totally controlled via PLC/Computer, overflow will be adjusted by the computer; otherwise,
- where a ME995 series Batch Controller is fitted with a Preact, simply set the Preact to the amount of overflow i.e.
  overflow = 
  (actual amount dispensed, as shown on the Batch Controller display) minus (amount requested).

If required:
- slow down flow velocity by using a restriction gate valve;
- avoid over-batching by using the Preact function, or installing a quick-acting solenoid valve.

Note: If the flow is restricted excessively, Batch Controller Pulse Fail circuitry will shut down the system for safety reasons, in which case open up the restriction gate valve.

---

2. Semi-Automatic Batching

No Filters required with MAGFLOWS

When using the CMM15,20,25 and MM Magflows the voltage step up converter is required Part # CV12-24 (12 to 24vdc)
