24VDC Powered Model with 24VDC I/O and 5-24VDC Pulse Output

FEATURES
- Up to 4 Dual-Channel Modules (DCMs) can be mounted on Motherboard, for the creation of a 2, 4, 6, or 8 channel unit.
- All parameters and entries are fully programmable via a plug-in hand held keypad.
- Pulse Comparator for optional Dual Flowmeter system.
- V1.8 software: can de-select the comparator function, so that each channel shows the reading from one flowmeter only.
- Dual Display Counters for each channel (for Comparator function).
- Input Pulse scalable for use with most types of Flowmeters.
- All display readouts in Litres to 3 decimal places, with instantaneous flowrate display reading.
- Accumulated batch totals (grand totals) for inventory records.
- Initial Start and Pulseeal Safety.
- Low and High Flow range settings. Pulseeal Safety safeguards against exceeding flowmeter operating ranges.
- Maximum pulse output frequency alarm, for PLC input safety.
- Maximum Batch Limit Safety.
- Output Pulse Division to PLC/Computer scalable.
- 5 to 24 VDC pulse switching. 24VDC Input/Output control relays.
- 24VDC powered (Use atleast a 3 Amps to power the unit)
- Manual Batch facility, with Disable option.
- Master Audible alarm function
- Alarm condition for leaky check valves (back flow).
- Can be used for NEW water channels with V1.9 firmware (upto 9000 ltrs.max).

INTRODUCTION
The ME2008 is a microprocessor-based batch safety interface card for management of flowmetering admixture liquids in the concrete production industries. Its design is at the request and requirement of suppliers/producers/users of construction chemical products. The software incorporates safety features designed to cover, detect and warn for most flowmetering faults during/after the batch cycle, making the flowmetering system one of the safest in the world. The ME2008 can be used with a wide range of signal output flowmeters in conjunction with a range of PLC/Computer auto batch systems. All message status functions are displayed at all times, and the settings are easily retrieved and displayed. This helps make the ME2008 very user-friendly. The unit consists of:

1x MOTHERBOARD (24VDC powered) complete with 8 individual pushbuttons for manual batch facility, along with a pushbutton to select (or scroll) menu functions, a button for manual reset of batch displays and a button for alarm muting (can be disabled), all enclosed in a wall/panel mount ABS enclosure.
1,2,3 or 4x DUAL CHANNEL MODULE (DCM) pluggable PCBs with dual-line LCD displays with backlight.
1x Hand held plug-in programmer for entering parameters.

OPERATION
Flowmeters of various sizes can be connected to the inputs. ME2008 accepts 8 external start commands. It delivers DC low voltage (sink or source 5 to 24 VDC) pulses to a PLC/computer with optical isolation. The ME2008 controls and manages up to 8 admixture products / 8 flowmeters (or up to 16 flow meters, 2 per channel, if you utilize the comparator function).

ME2008 can be used as a manual pushbutton batch controller unit. This function can be disabled via a link for computer control only start operations. The handheld plug-in programmer is unplugged after all parameters have been setup.

When the PLC/Computer system starts, the ME2008 begins counting in millilitres, and the output pulses are re-transmitted to the PLC/Computer input at the divided pulse value. A sophisticated safety management watches for any malfunction in the system, flowmeter or batch computer during the batch cycle. If a fault is detected, the ME2008 will override and shutdown the faulty channel, and give alarm warnings. The computer provides auto reset at completion of batch, resetting all counters. All activity is logged on grand totalisers for inventory management data. Also included is an instantaneous flowrate reading per channel, which indicates if the operating range of each flowmeter is exceeded.

ME2008-8-1D-2D-3C
Simultaneous batching of all 8-channels without any sequencing requirements of starts.
INSTALLATION

Find an appropriate position to mount the ME2008 housing box, preferably within visual distance to operator. Using flexible wires, wire the ME2008 according to the diagrams:

- Figure 1A on page 3
- Figure 2. Motherboard Wiring Diagram, on page 4
- Figure 3. Dual Channel Module (DCM), on page 4
- Figure 4. Dual Module (DCM) wiring, on page 5

The normal order of connections is:

1. Connect the computer’s or a dedicated 24VDC power supply rated to at least 3 Amps module to the positive (+) and negative (–) 24VDC to the Motherboard power input X5 plug (4-pin green coloured plug) – only top two pins used. (see Figure 3, Page 4)

2. Connect the computer’s 24VDC Reset control signal to the top pin only (marked RST) of the Motherboard X1 plug (3-pin green coloured plug). (see Figure 3, Page 4)

3. Using shielded cable, connect flowmeters (with no earthing on the bodies of the flowmeters) to the ME2008’s Dual Channel Modules (DCMs), as shown in Figure 3 and Figure 4 (pages 4 and 5). Use minimum 2-core shielded cable per flowmeter to the DCM’s X4 plug (6-pin, green coloured). If using one flowmeter per channel, use Pulse 1A and Pulse 2A, and +12 VDC and S (Shield) = 0.V, which are both common for flowmeters. (1 x 6pin green plug connector per channel).

NOTE: B pulse inputs are used for dual flowmeters per channel for Comparator function. If not using comparator dual flowmeters, then bridge pulse 1A to pulse 1B, and bridge pulse 2A to 2B. If equipped with software V1.8 or higher then set “Diff. Channels” = “1” and NO need to bridge out. (see Page 7, no.13) (V1.9 for WATER Channel type).

4. (a) For first channel:
   - connect the 24 VDC START signal from PLC/Computer to the DCM X2 plug (6-pin, black coloured), pin S1.
   - connect the 24 VDC ACTIVE side of the contactor coil to DCM X2 plug, pin R1. Connect negative side of contactor to the DC power supply negative (see Error! Reference source not found.). Page Error! Bookmark not defined.).
   (b) Similarly connect for the second channel, using DCM X2 plug pins S2 and R2.
   (c) For low voltage DC (5 - 24 VDC) pulse output to the PLC/Computer, connect the DCM X3 plug (4-pin white coloured, C1 = Collector, E1 = Emitter) for Channel 1 and then c2/e2 for Channel 2 to the PLC/Computer’s pulse input. (see Figure 4, Page 4 and Figure 5, Page 5).

REPEAT Same procedures for up to all 4 modules.

5. As shown in Figure 5 on page 5, for DC control logic the DCM is fitted with 4N33 5 - 24VDC OPTOs marked as U3 and U4. (note the placing position.)

6. To disable the front MANUAL batch pushbuttons, remove link LK1 located on motherboard near the Alarm buzzer (see Figure 2 on page 4). This will avoid misuse of manual starts. The other manual functions “Select”, “Mute” and “Reset” will be still fully functional. Plug-in LK1 to re-activate manual batch functions.

7. The entry of program parameter data is achieved with a 4-button keypad programmer (see Figure 1 Figure 1. Programmer) that is plugged onto the 5-pin inline Data Entry Plug-In plug rail located on each Dual Channel Module (as shown in Figure 3 on page 4). The programmer plug is keyed so that it can only be plugged in the correct way.

Each Dual Channel Module (DCM) is programmed one at a time. Plug the Programmer into the DCM to be programmed (the programming plug location is shown in Fig.3 on page 4). If equipped with external programming panel (8CAT5E for 8 channel), connect the programmer CAT5E plug to the external panel with marked channels 1 to 8 (2 channels per terminal). As above.

To start programming, push either arrow button (→ ↔) on the Programmer. Cursor (digit) will flash on the DCM display. Push UP or DOWN to change numeric values. Push arrows to scroll through the individual numeric settings. Once programming is completed, push either arrow button (→ ↔) until no digits are blinking, data is now entered into memory. Unplug the Programmer, then plug it in to the next module and repeat data entry to programme another module.

See OPERATING INSTRUCTIONS on page 7, for program menu display and description. Note: For guide to entering complete data safety features for each flowmeter type, see Flowmeters Data Guide on page 11.
REQUIRES: Requires a minimum 3 Amps > rated external power supply.

REM00E08-100-200-300

---

**Figure 3.** Dual Channel Module (DCM)

- **X2. Black plug**: RED Opto Start 1, Contactor Coil 1.
- **X3 white plug**: Low voltage output pulses. c = collector, e = emitter.
- **X4 green plug**: For software V1.7 and below, if not using comparator dual flowmeters then must bridge 1A to 1B and bridge 2A to 2B.

**Important Note:**

Contactor drive is from Computer’s power supply line. Do not connect a negative feedback from PLC to ME2008.

**Note:**

Dual Channel Modules for the ME2008 and ME2000 have slightly different component layouts (the most obvious is the Data Entry Plug-in location) but the boards are functionally equivalent and are interchangeable.

</table>

**K-factor / Calibration:**

sets pulse input value per litre, according to flowmeter used e.g. MES20 1000 pulses/litre, MES25 0555 pulses/litre.

⇒ 5. Push Select:

<table>
<thead>
<tr>
<th>Output (l/p)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00.010</td>
</tr>
<tr>
<td>00.010</td>
</tr>
</tbody>
</table>

**Pulse Output** Volume Value (Litres /pulse).

Sets division of output pulses to suit computer/PLC.

Resolution from 1ml. Example shows 10ml.

See also “Program Record Sheet” (page 12).

⇒ 6. Push Select:

<table>
<thead>
<tr>
<th>Min. Flow (l/s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>00.010</td>
</tr>
<tr>
<td>00.010</td>
</tr>
</tbody>
</table>

**Minimum flowrate**

(set this according to flowmeters’ recommended minimum). Pump will be stopped if the flowrate falls below this value.

Previously known as **Pulsefail** in ME697, ME995/188 units.
7. Push Select:

<table>
<thead>
<tr>
<th>Max. Flow (l/s)</th>
<th>Maximum flowrate</th>
</tr>
</thead>
<tbody>
<tr>
<td>01.000</td>
<td>(set this according to flowmeters’ recommended maximum). Pump will be stopped if the flowrate exceeds this value.</td>
</tr>
</tbody>
</table>

8. Push Select:

<table>
<thead>
<tr>
<th>Dose Limit (l)</th>
<th>Sets maximum acceptable limit per batch (overrides computer selection). If limit is reached, pump is stopped and “Overdose” warning will be displayed.</th>
</tr>
</thead>
<tbody>
<tr>
<td>010.000</td>
<td></td>
</tr>
</tbody>
</table>

9. Push Select:

<table>
<thead>
<tr>
<th>Max Backflow (l)</th>
<th>The Backflow function raises an alert if the check (non-return) valves leak. Set to the desired maximum allowance of backflow.</th>
</tr>
</thead>
<tbody>
<tr>
<td>000.100</td>
<td></td>
</tr>
</tbody>
</table>

10. Push Select:

<table>
<thead>
<tr>
<th>Difference (%)</th>
<th>COMPARATOR (5% = ± 2.5%) Optional Function. This function is used to compare 2 flowmeters in series. If the flowmeters differ by more than the allowed percentage, the pump will be stopped and an alarm triggered.</th>
</tr>
</thead>
<tbody>
<tr>
<td>05.0</td>
<td></td>
</tr>
</tbody>
</table>

11. Push Select:

<table>
<thead>
<tr>
<th>Start Delay (s)</th>
<th>Start Delay is the time (in seconds) allowed for pump to start before the Pulse Fail safeties activate. After the Start Delay period, the safeties will shut down the pump drive if no flowmeter pulses are received.</th>
</tr>
</thead>
<tbody>
<tr>
<td>02.0</td>
<td></td>
</tr>
</tbody>
</table>

12. Push Select:

<table>
<thead>
<tr>
<th>Stop Delay (s)</th>
<th>Stop Delay is the time (in seconds) allowed for the pump to settle after stopping, before back flow detection commences.</th>
</tr>
</thead>
<tbody>
<tr>
<td>02.0</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Diff. channels</th>
<th>Difference Channels: enables/disables the comparator function, for each channel of the two-channel module. When value is “1”, the comparator is disabled, and the display for that channel shows the reading from the one flowmeter installed. When value is set to “2”, the comparator is enabled, and the display for that channel shows the readings of two flowmeters installed in series.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td></td>
</tr>
</tbody>
</table>

14. Push Select:

Max Out Rate(\(\text{Hz}\))

0040

Max Out Rate is the maximum allowed rate of output pulses to the PLC/computer’s input. If the maximum is exceeded, then the drive to pump contactors stops, the ME2008 stored buffered memory sends the extra pulses to the PLC/Computer’s DC White Optos (under the 40 Hz max. input rate) or to low scanrate systems. This safeguards against any overdoses which could occur if PLC does not capture all incoming pulses.

NOTE:

1) DO NOT SET THE MAX OUT RATE UNNECESSARILY HIGH, as this will affect the duty cycle of the pulses (i.e. will narrow the pulse width) which may make it difficult for the receiving PLC to detect the pulses.

Example: if the receiving PLC can only detect pulses at a rate up to 40 Hz, then set MAX OUT RATE to 40 and not to 100.

2) Extra pulses received (above the allowed rate) represent actual extra volume measured by the flowmeter and ME2008, but which would have otherwise not been fully counted by the PLC/Computer system. (This situation is different to actual “inflight overflow”, where a DEDUCT value must be programmed in the computer system to stop the pump earlier).

IMPORTANT: Some PLC/Computers that accept DC input pulses via “White” optos have a pulse input frequency limit of 40 Hz, so for the ME2008 to protect such systems and prevent overdose, set values in the ME2008:

* MAX OUT RATE to 40 Hz or less

* OUTPUT (LITRES/PULSE) to a value so that, at your maximum operating flowrate, pulses to PLC/Computer will not exceed 40 Hz.

Example:

If your operating flowrate is 60 Litres/minute, and you set OUTPUT (LITRES/PULSE) = 0.050 (i.e. 50 mls/pulse), the ME2008 will output 20 pulses/second (i.e. < 20 Hz) to the PLC/Computer well below the 40Hz. Max pulse rate.

15. Push Select:

MANU ELECTRONICS

ME2008 V1.8

Returns to intro display.

Note: V1.9 software is for Water channel options

16. Push Reset:

000.000  000.000

000.000  000.000

Returns to the Batch function.

Display is in “LITRES” to 3 decimal places.

WARNING

Only after all products are batched, should totals be reset (does not affect accumulated totals).

All ME2000/2008 should be upgraded with the latest v1.8 software. Micro chips can be purchased & plugged-in.

Before you leave the plant, you must take a VOLUMETRIC calibration of quantity dispensed and cross-reference with ME2008 readings !!!

ALARM SAFETY STATUS

If any of the safety features are triggered, the relevant alarm will come on. The Display will indicate status of the channel that is in alarm condition (see message explanations on page 11). In this case, as a precaution the ME2008 will shut down pump drive of the faulty channel only, allowing for further examination of the problem.

SAFETY PROCEDURE IN EXAMINING THE PROBLEM

If the alarm comes on, DO NOT push RESET immediately - just push MUTE to silence alarm, then observe display and take note of batch readings and alarm message. Address the problem if possible.

WAIT for other channels to complete batch, then push RESET to be ready for the next batch.

ME2008 - SPECIFICATIONS

Display
One 2x16 character dot matrix backlit display per Dual Channel Module (DCM).

Motherboard
Accepts up to 4 plug-in Dual Channel Modules.

Power Supply
24VDC via Motherboard X5 green plug. (See options guide for other voltages)

Current Draw
1.8 Amps max. (≥ 3 amp Power Supply Recommended)

Supply to Flowmeters
12 VDC (10mA per flowmeter), via DCM X4 green plug.

Pulse Inputs
NPN sink pulse or Reed Switch pulses via DCM X4 green plug, 2 flowmeters per module (4 for comparator). Input calibration to 3 decimal places. Most types of flowmeters can be connected and calibrated.

Input count speed
2 kHz maximum.

Output pulses to computer
5-25 VDC sink/source pulse via 4N33 open collector opto (DCM X3 white plug). (7500V rms surge protection). All pulses are divided via “Output Pulse Value” calibrator.

Computer starts/runs
24 VDC via DCM X2 black plug.

Computer reset
24 VDC via Motherboard X1 green plug.

Manual Batch Commands
Starts: 8 momentary-hold push buttons for each channel (when link enabled).
Master Reset: 1 pushbutton. MUTE: 1 pushbutton. SELECT: 1 pushbutton.

LED functions
“Output” (divided pulses) indicated via flashing LEDs
“Run” (manual starts/computer starts) indicated via illuminated LEDs.

Power ON/OFF
Via “Power” switch.

Wiring/Connection
Wired via cable mount plugs. DCM connected via mated plugs, allows unplugging of PCBs for easy replacement.

Fuse
2.5 Amps. Fuse holder on motherboard. 20x5mm type

Enclosure & Dimensions
IP58 ABS lid/box. Size: 310mm L x 245mm W x 140mm D.

Weight (with 3 modules)
2.6 kg

Display Functions

Operation
Via plug-in 4-button hand-held programmer.

Volume displayed
In Litres, to 3 decimal places (smallest increment is 1 millilitre).

Flowrate display
In Litres per Second (l/s), to 3 decimal places.

Grand Total
In total Litres (1).

Input calibration
Pulses per Litre, to 9999.99 (Default:1000.00 = MES20)

Output pulse value
From 0.001 to 99.999 Litres per pulse (Default: CH1: 00.010, CH2-8: 00.100)

Min flowrate safety
From 0.001 to 99.999 Litres per second (Default: CH1: 00.010, CH2-8: 00.400)

Max flowrate safety
Max. 99.999 Litres per second (Default: 01.000 all channels)

Dose Limit
Max. 999.999 Litres per batch cycle (Default: CH1: 010.000 CH2-8: 20.000)

Max Backflow
From 000.001 to 999.999 Litres (Default: CH1: 000.100 CH2-8: 000.400)

Comparator difference
0.1 to 99.9% (Default: 5.0% i.e. +/-2.5%)

Start Delay
0.1 to 99.9 seconds (Default: 2.0)

Stop Delay
0.1 to 99.9 seconds (Default: 2.0)

Diff. Channels
Arm/disarm difference function 1=off, 2=on (Default: 1=off, 1 flowmeter only)

Max Output pulse rate
0001 to 9999 Hz (Default: 14)

Max Safe Flowrate not to exceed computers Current DC digital input count limit speed of 35Hz (B flowmeter max) (gset in Max. Out Rate)  

NOTE: ME2000 can emit 1mls/1 pulse if PLC computer input cards have high speed input capability. (Output overrun is set to 35Hz to safeguard the system settings).

KMS/RMS ManuFlo and other Electromagnetic Flowmeters

15mm & 25mm = 100ppl. | 40mm & 50mm = 10ppl. See the ManuFlo RMS Datasheet for flowrates.

Many other types of flowmeters can be used with the ME2008.

Order Codes for ME2008

ME2008-6 6 channel unit (3 module) then must also choose one option from at least EACH of the following three groups:

(1) Power Supply

-1A 240 vac power supply
-1B 110 vac power supply
-1C 24 vac power supply
-1D 24 VDC power supply

(2) Start Input/Output Drives & Master Reset (from PLC starts)

-2A 240 vac start/reset relay logic fitted.
-2B 110 vac start/reset relay logic fitted.
-2C 24 vac start/reset relay logic fitted.
-2D 24 VDC start/reset relay logic fitted.
-2E 12 VDC start/reset relay logic fitted. Negative switching.

(3) Pulse Output (to PLC input pulses)

-3A 240 vac Moc3041 triac pulse output switching (only with ’1A’ 240vac power supply option)
-3B Same ac voltage as for the start/reset option (i.e. 24vac or 110vac)
-3C 5-30 VDC Open Collector pulse output. Suits CommandBatch / Jonel / other computers.

Other Options

-V1.8 Software version with option to disable comparator function (each channel has 1 counter per flowmeter instead of 2)
-IR Independent Resets for each 2-channel module in the ME2008.
-USA USA units (non-metric) e.g. Gallons.
-8CAT5E 4-way external panel, for programming up to 4 dual modules (includes HP-CAT5E)

Spare

HP-CAT5E Programmer with CAT5E plug.
HP Spare hand-held plug-in keypad programming module.
HK Hinge Kit.

All other program parameters can be factory-entered or done via the plug-in programmer (see diagram above) onsite.

ME2008 - Technical Guide

Lightning and Power Supply to ME2008 24VDC Model Only
- The 24VDC power must come from the PLC/Computer or dedicated power supply, which should have lightning arrestors already fitted to its Uninterruptable Power Supply (UPS).
- To be safe, a power supply rated to at least 3 Amps or more be used to supply power to the DC version ME2008.

**Pulse Output**
From software version V1.7, the pulse output drive to the PLC optos is kept low when there are no output pulses.

**Comparator Function Explained**
The reason for using 2 flowmeters per admix line is to have a double safety system against possible overdoses (used in Hong Kong). Comparator flowmeters should be installed within 3 metres of each other.

In the event of one flowmeter malfunctioning in any way, the other flowmeter will operate as normal and the ME2008 will warn the operator of any unusual discrepancy between the two meters. Examples of possible flowmeter malfunctions include: clutching or jamming of measuring chamber due to foreign particle contamination; clutching of flowmeter due to broken components; excessive wear affecting accuracy tolerances of opposing measuring chambers; electronic pulse failure or intermittent or excessive counts.

The ME2008 Comparator function is calculated by a mathematical algorithm applied to the flowrate in order to produce a stable display and calculate difference between the two flowmeters. If flowmeter A1 flows slower than flowmeter A2 or vice-versa and reaches the set differential channel percentage limit, the ME2008 will stop the batch, alarm will sound and LCD display will indicate “Diff. Flow”.

As a general rule, between the two LCD total displays for A1 and A2, the display that shows the higher volume is generally the correct one. To make sure, conduct a volumetric calibration test of 1 Litre. Then compare with the ME2008 displays for that admixture - the display which differs most from the actual value is the faulty flowmeter.

### TROUBLESHOOTING GUIDE

<table>
<thead>
<tr>
<th>Text on the LCD display/Alarm</th>
<th>Possible Cause</th>
<th>Remedy</th>
</tr>
</thead>
<tbody>
<tr>
<td>“Low Flow”</td>
<td>- Flow Rate below setting</td>
<td>- Check &quot;Min. flow&quot; value</td>
</tr>
<tr>
<td></td>
<td>- Pulse Fail due to flowmeter failure</td>
<td>- Check flowmeter &amp; pulse cable wiring</td>
</tr>
<tr>
<td></td>
<td>- Airlock in flowline</td>
<td>- Check delivery line for line restriction</td>
</tr>
<tr>
<td></td>
<td></td>
<td>- All OK then return to ManuFlo for upgrade to v1.8 software *new Power upgrade</td>
</tr>
<tr>
<td>&quot;High Flow&quot;</td>
<td>- Flow Rate above Max.-Flow setting</td>
<td>- Check ‘Max. flow’ value, has been exceeded</td>
</tr>
<tr>
<td>&quot;Output Overrun&quot;</td>
<td>- Higher pulse rate than pulse out cut off frequency (AC=15Hz, DC=35Hz).</td>
<td>- Check ‘Max. Out Rate’ value</td>
</tr>
<tr>
<td>&quot;Over Dose”</td>
<td>- Dose Limit exceeded during batch</td>
<td>- Adjust pulse output value resolution</td>
</tr>
<tr>
<td>&quot;Back Flow”</td>
<td>- Backflow of liquid after batch complete</td>
<td>- Check Flow Rate, restrict the gate valve.</td>
</tr>
<tr>
<td></td>
<td>- Or excessive vibration at flowmeter install</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- Stuck external contactor/pump.</td>
<td></td>
</tr>
<tr>
<td>&quot;Diff Flow” (where used)</td>
<td>- Flowmeter Percent difference 5% exceeded (when comparator function is used with 2 flowmeters per 1 line)</td>
<td>- Check Non-return valve, clean or replace</td>
</tr>
<tr>
<td></td>
<td>- Power Surge or major power loss to systems</td>
<td>- Eliminate vibration source or swap with MES-DSP vibration free smart pulse-heads</td>
</tr>
<tr>
<td>&quot;Setting Lost”</td>
<td>- Check flowmeters</td>
<td>- see also Troubleshooting-Backflow on next page</td>
</tr>
<tr>
<td></td>
<td>(see comparator function explained)</td>
<td>- rare case continuous backflow is external stuck contactor/pump running</td>
</tr>
<tr>
<td></td>
<td></td>
<td>kill power, replace contactor/pump or ME2000 drive relay stuck.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(If the flow runs substantially backwards after batches this will result in short under batches of liquid volumes)</td>
</tr>
</tbody>
</table>

**WARNING**: On powering up the unit allow 30 seconds for ME2000/08 to fully boot up all functionalities before use.

Or short the 2 pins as shown

**TROUBLESHOOTING - BACKFLOW**

In some installations with older MES meters, the ME2008 may slowly count without batching being in progress, causing a “Back Flow” alarm.

1. Usually, this is due to the Non-Return Valve not closing, thus allowing backflow which results in counts as the liquid runs back thru the flowmeter (PD types). Ensure that the Non-Return Valve is clean and operating correctly.
2. If Non-Return Valve is OK, then ensure that shielded cable is used. If cable is not shielded, then interference can be picked up and transmitted to the ME2008 which will interpret it as backflow.
3. If shielding is OK, then possible cause is vibration in plant near MES meters. Install flowmeters away from vibration causes, or anchor meters with rubber mounts.
4. If after batch complete and the **shut off valve fails** to close, then “backflow” alarm will engage.
5. **If vibration is still prevalent, then upgrade with new MES-DSP-OC pulseheads is recommended.** New all solid state smart technology (Forward/Reverse flow) are vibration free and interchangeable with old style pulseheads.
MES larger flowmeters or replacing with MAGFLOW - INSTALLATION and PROGRAMMING

A. Replace MES body.
B. Program the ME2008 Input Pulse to suit the K-factor of the large body (K-factor pulses/litre will be lower)
C. Change other program factors to suit flowmeter/appl. specs.
D. VERY IMPORTANT
   After replacement and programming of a flowmeter, take a calibration test before you leave the plant.

**ME2008 DISPENSER INTERFACE IN CASE OF ALARM WARNING:**

- If any of the safety features are triggered, the alarm will sound.
- The Display will indicate message status condition of the channel that is in alarm condition, as a precaution the ME2008 will shut down pump drive of the faulty channel only, allowing further examination of the problem.
- **DO NOT** push RESET immediately - observe display and take note of the batch readings and the alarm message.
- WAIT for other channels to complete batch, then push RESET to be ready for the next batch.
- If batcher gets an Alarm again at batching, then:
  - **MOVE THE TRUCK MIXER AWAY FROM THE LOADING POINT**
    - stop using that chemical channel; as each attempt doses 2 seconds worth of chemical into the mix.
    - record the quantity displayed on the ME2008 and the batch computer; and ring your local admixture supplier for advice/service.

**ME2008/08 calibration adjustment guide**

A volumetric calibration test is performed when commissioning a new installation and periodic follow-up tests.
- To calibrate a vessel is placed near the sink or by-pass port, a selected batch quantity is either:
  a) set on computer and batched or
  b) can be manually batched by push & holding the manual batch override button.

Now compare volume displayed on ME2008 Display and that collected.
If incorrect check flowmeter specification pulse output value which must match the input Pulses per Litre (PPL),
e.g. MES20 =1000ppl so Input p/L K-factor must be same 1000.00 p/L (on pg.131 [menu:4]).
Then divided output pulse value Output L/p.e.g. 30.100 must match the computer input pulse value = 100mL/p.

**Final Calibration:**
- if the liquid collected is more than pulse value shown on computer screen or volumetric amount on display,
  then decrease the calibration input set value (K-factor) by the same % difference
- if the liquid collected is less than pulse value shown on computer screen or volumetric amount on display,
  then increase the calibration input set value (K-factor) by the same % difference
- Note: Final calibration check can also be performed via computer software scaling.

Possible Reasons for Less fluid collected than indicated:
- Fluid back flow due to faulty non-return valve.
- Input K-factor set too low. Faulty Flowmeter so replace it.
Possible Reasons for More fluid collected than indicated:
- Input K-factor set too high. Output Rs & PLC input not matching.
- Flowmeter worn out, or parts missing, change flowmeter.

Take a few volumetric test volumes of say 0.25, 0.5, 1.0 or 2.0 Litres. The percentage difference should be repeatable the same.

If so its is a digital error—the settings, if not then it is analogue error—the install/meter.

If in doubt, call your local installer / Admix Supplier or contact ManuFlo on phone +61 2 9938 1425 or +61 2 9905 4324.
