ME2008 Microprocessor Interface Controller Safety Card
Flowmeter to Computer / PLC batch plants up to 8 channels

FEATURES
- Up to 4 Dual-Channel Modules (DCMs) can be mounted on Motherboard, for the creation of a 2, 4, 6, or 8 channel unit.
- All parameters and entries are fully programmable via a plug-in hand held keypad.
- Pulse Comparator for optional Dual Flowmeter system.
- V1.8 software: can de-select the comparator function, so that each channel shows the reading from one flowmeter only.
- Dual Display Counters for each channel (for Comparator function).
- Input Pulse scalable for use with most types of Flowmeters.
- All display readouts in Litres to 3 decimal places, with instantaneous flowrate display reading.
- Accumulated batch totals (grand totals) for inventory records.
- Initial Start and Pulsefail Safety
- Low and High Flow range settings. Pulsefail Safety safeguards against exceeding flowmeter operating ranges.
- Maximum pulse output frequency alarm, for PLC input safety.
- Maximum Batch Limit Safety.
- Output Pulse Division to PLC/Computer scalable.
- 24-240 vac pulse switching & input/output controls. (optional 5-24vdc).
- 240 VAC powered (Use atleast a 2.5 Amps to power the unit)
- Manual Batch facility, with Disable option.
- Master Audible alarm function,
- Alarm condition for leaking check valves (back flow).
- Can be used for NEW water channels (upto 9000 ltrs.max.)

INTRODUCTION
The ME2008 is a microprocessor-based batch safety interface card for management of flowmetering admixture liquids in the concrete production industries. It’s design is at the request and requirement of suppliers/producers/users of construction chemical products. The software incorporates safety features designed to cover, detect and warn for most flowmetering faults during/after the batch cycle, making the flowmetering system one of the safest in the world. The ME2008 can be used with a wide range of signal output flowmeters in conjunction with a range of PLC/Computer auto batch systems. All message status functions are displayed at all times, and the settings are easily retrieved and displayed. This helps make the ME2008 very user-friendly. The unit consists of:

1x MOTHERBOARD (24VDC powered) complete with 8 individual pushbuttons for manual batch facility, along with a pushbutton to select (or scroll) menu functions, a button for manual reset of batch displays and a button for alarm muting (can be disabled), all enclosed in a wall/panel mount ABS enclosure.

1,2,3 or 4x DUAL CHANNEL MODULE (DCM) plugable PCBs with dual-line LCD displays with backlight.

1x Hand held plug-in programmer for entering parameters.

OPERATION
Flowmeters of various sizes can be connected to the inputs. ME2008 accepts 8 external start commands. It delivers DC low voltage (sink or source 5 to 24 VDC) pulses to a PLC/computer with optical isolation. The ME2008 controls and manages up to 8 admixture products / 8 flowmeters (or up to 16 flowmeters, 2 per channel, if you utilize the comparator function).

ME2008 can be used as a manual pushbutton batch controller unit. This function can be disabled via a link for computer control only start operations. The handheld plug-in programmer is unplugged after all parameters have been setup.

When the PLC/Computer system starts, the ME2008 begins counting in millilitres, and the output pulses are re-transmitted to the PLC/Computer input at the divided pulse value. A sophisticated safety management watches for any malfunction in the system, flowmeter or batch computer during the batch cycle. If a fault is detected, the ME2008 will override and shutdown the faulty channel, and give alarm warnings. The computer provides auto reset at completion of batch, resetting all counters. All activity is logged on grand totalisers for inventory management data. Also included is an instantaneous flowrate reading per channel, which indicates if the operating range of each flowmeter is exceeded.
INSTALLATION

Find an appropriate position to mount the ME2008 housing box, preferably within visual distance to operator. Using flexible wires, wire the ME2008 according to the diagrams:

- Figure 2. Full Schematic Diagram, on page 3
- Figure 3. Motherboard Wiring Diagram, on page 4
- Figure 4. Dual Channel Module (DCM), on page 4
- Error! Reference source not found., on page 5

The normal order of connections is:

1. On the motherboard (see page 3), connect 240VAC supply to computer supply to reduce industrial noise (X5 plug, which is a 4-pin green-coloured plug). L is active load, N is neutral, E is earth.

2. Connect the computer’s 240VAC Master Reset control signal to the top pin only (marked RST) of the Motherboard X1 plug (3-pin green coloured plug). (see Figure 3, Page 4)

3. Using shielded cable, connect flowmeters (with no earthing on the bodies of the flowmeters) to the ME2008’s Dual Channel Modules (DCMs), as shown in Figure 4 and Error! Reference source not found. (pages 4 and 5) . Use minimum 2-core shielded cable per flowmeter to the DCM’s X4 plug (6-pin, green coloured). If using one flowmeter per channel, use Pulse 1A and Pulse 2A, and +12 VDC and S (Shield) = 0 V, which are both common for flowmeters. (1 x 6pin green plug connector per channel).

NOTE: B pulse inputs are used for only dual flowmeters per channel for Comparator function.

If NOT using comparator dual flowmeters, then bridge pulse 1A to pulse 1B, and bridge pulse 2A to 2B.

If equip with software V1.8 or higher then set “Diff. Channels” = “1” and NO need to bridge out. (see Page 7, no.13)

4. (a) For first channel: (see Figure 2 page 3 and Fig.4 page 4 and Fig.5 page 5 ).
   - connect the 240 VAC START signal from PLC/Computer to the DCM X2 plug (6-pin, black coloured), pin S1. To the black Opto.
   - connect the 240 VAC ACTIVE side of the contactor coil to DCM X2 plug, pin R1. Connect neutral side of contactor to the AC power supply of the ME2008
   - Connect the 240VAC PULSE input from the PLC/Computer (yellow Opto) to the DCM X2 plug, pin O1.

(b) Similarly connect for the second channel, using DCM X2 plug, pins S2, R2 and O2.

   REPEAT Same procedures for upto all 4 modules.

IF USING low voltage DC (5 - 24 VDC) pulse output to the PLC/Computer, connect the DCM X3 plug (4-pin white coloured, C1 = Collector, E1 = Emitter for Channel 1 and then C2/E2 for Channel 2 to the PLC/Computer’s pulse input.

5. As shown in Figure 5 on page 5, for AC control logic the DCM is fitted with MOC3041 24-240VADC OPTOs marked as U1 and U2. (note the placing position.)

6. To disable the front MANUAL batch pushbuttons, remove link LK1 located on motherboard near the Alarm buzzer (see Figure 3 on page 4). This will avoid misuse of manual starts. The other manual functions “Select”, “Mute” and “Reset” will be still fully functional. Plug-in LK1 to re-activate manual batch functions.

7. The entry of program parameter data is achieved with a 4-button keypad programmer (see Figure 1 Figure 1. Programmer) that is plugged onto the 5-pin inline Data Entry Plug-In plug rail located on each Dual Channel Module (as shown in Figure 4 on page 4). The programmer plug is keyed so that it can only be plugged in the correct way.

Each Dual Channel Module (DCM) is programmed one at a time. Plug the Programmer into the DCM to be programmed (the programming plug location is shown in Figure 4 on page 4).

If equiped with external programming panel (8CAT5E for 8 channel), connect the programmer CAT5E plug to the external panel with marked channels 1 to 8 (2 channels per terminal). See as above

To start programming, push either arrow button ( → ← ) on the Programmer. Cursor (digit) will flash on the DCM display. Push UP or DOWN to change numeric values. Push arrows to scroll through the individual numeric settings. Once programming is completed, push either arrow button ( → ← ) until no digits are blinking, data is now entered into memory. Unplug the Programmer, then plug it in to the next module and repeat data entry to programme another module.

See OPERATING INSTRUCTIONS on page 5, for program menu display and description. Note: For guide to entering complete data safety features for each flowmeter type, see Flowmeters Data Guide on page 11.
Figure 2. Motherboard Wiring Diagram, 240vac supply, with 240vac I/O

- Requires > 2.0 Amps
- 240vac Supply
- X1 green plug
- Alarm buzzer
- X5 green plug
- RST = Master Reset

Remove link plug LK2
To disable front manual batch pushbuttons

Figure 4. Dual Channel Module (DCM)

Note: Dual Channel Modules for the ME2008 and ME2000 have slightly different component layouts (the most obvious is the Data Entry Plug-in location) but the boards are functionally equivalent and are interchangeable.

X2. Black plug

Black Opto Start 1: S1
Contactor Coil 1: R1
Yellow Opto Pulses 1: O1
Black Opto Start 2: S2
Contactor Coil 2: R2
Yellow Opto Pulses 2: O2

U1 & U2 MOC3043 AC pulse optos

If using 5VDC output pulses to white optos

To Flowmeters

X4. Green plug

Note: For software V1.7 and below, if not using comparator dual flowmeters then must bridge 1A to 1B and bridge 2A to 2B

IMPORTANT: Contactor drive is from Computer’s power supply line. Do not mix Neutrals from different phases
NOTE: if not using comparator dual flow meters, then must bridge 1A to 1B, and 2A to 2B

IMPORTANT: Contactor drive Neutral is from Computer’s power supply line. Do not mix Neutrals from different phases.

* Note: M2 and M4, if used, are Comparator flowmeters.

FLOWMETER 1
(M1)

FLOWMETER 2
(M2)

240VAC option shown
wired with PLC I/Os, flowmeters, pumps.
**OPERATING INSTRUCTIONS**

* Switch on power to the ME2000 interface safety unit. * Scroll through the settings by pressing SELECT. Refer to the Display Diagram below for procedures and settings of required parameters. * See “Flowmeter Data Guide” on page 11 for recommended data for each flowmeter type/size characteristics/flowrates.

ME2008 Display Menu

⇒ Power On:

MANU ELECTRONICS
ME2008 V1.8

⇒ 1. Push Select:

<table>
<thead>
<tr>
<th>Batching function display in “LITRES” to 3 decimal places. At anytime you can skip functions and return to normal by pushing RESET (You cannot reset while pumping is in progress).</th>
</tr>
</thead>
<tbody>
<tr>
<td>000.000 000.000</td>
</tr>
<tr>
<td>000.000 000.000</td>
</tr>
</tbody>
</table>

⇒ 2. Push Select:

<table>
<thead>
<tr>
<th>Flow Rate Function in Litres/second (to 3 decimal places).</th>
</tr>
</thead>
<tbody>
<tr>
<td>000.000 000.000</td>
</tr>
</tbody>
</table>

⇒ 3. Push Select:

<table>
<thead>
<tr>
<th>Grand Total accumulation. To reset: push 2 buttons at once on 4-button programmer.</th>
</tr>
</thead>
<tbody>
<tr>
<td>000000 000000</td>
</tr>
</tbody>
</table>

⇒ 4. Push Select:

<table>
<thead>
<tr>
<th>K-factor / Calibration: sets pulse input value per litre, according to flowmeter used e.g. MES20 1000pulses/litre, MES25 0555pulses/litre.</th>
</tr>
</thead>
<tbody>
<tr>
<td>1000.00 1000.00</td>
</tr>
</tbody>
</table>

⇒ 5. Push Select:

<table>
<thead>
<tr>
<th>Pulse Output Volume Value (Litres /pulse). Sets division of output pulses to suit computer/PLC. Resolution from 1ml. Example shows 10ml. See also “Program Record Sheet” (page 12).</th>
</tr>
</thead>
<tbody>
<tr>
<td>00.010 00.010</td>
</tr>
</tbody>
</table>

⇒ 6. Push Select:

<table>
<thead>
<tr>
<th>Minimum flowrate (set this according to flowmeters’ recommended minimum). Pump will be stopped if the flowrate falls below this value. Previously known as Pulsefail in ME697, ME995/188 units.</th>
</tr>
</thead>
<tbody>
<tr>
<td>00.010 00.010</td>
</tr>
</tbody>
</table>
7. Push Select: 

| Max. Flow (l/s) | 01.000 01.000 |

**Maximum flowrate**
(set this according to flowmeters’ recommended maximum). Pump will be stopped if the flowrate exceeds this value.

8. Push Select: 

| Dose Limit (l) | 010.000 010.000 |

Sets maximum acceptable limit per batch
(overrides computer selection). If limit is reached, pump is stopped and “Overdose” warning will be displayed.

9. Push Select: 

| Max Backflow (l) | 000.100 000.100 |

The **Backflow** function raises an alert if the check (non-return) valves leak.
Set to the desired maximim allowance of backflow.

10. Push Select: 

| Difference (%) | 05.0 05.0 |

**COMPARATOR** (5% = ± 2.5%) **Optional Function**.
This function is used to compare 2 flowmeters in series.
If the flowmeters differ by more than the allowed percentage, the pump will be stopped and an alarm triggered.

11. Push Select: 

| Start Delay (s) | 02.0 02.0 |

**Start Delay** is the time (in seconds) allowed for pump to start before the Pulse Fail safeties activate. After the Start Delay period, the safeties will shut down the pump drive if no flowmeter pulses are received.

12. Push Select: 

| Stop Delay (s) | 02.0 02.0 |

**Stop Delay** is the time (in seconds) allowed for the pump to settle after stopping, before back flow detection commences.

13. Push Select:  

| Diff. channels | 1 1 |

**Difference Channels** : enables/disables the comparator function, for each channel of the two-channel module. 
When value is “1”, the comparator is disabled, and the display for that channel shows the reading from the one flowmeter installed. 
When value is set to “2”, the comparator is enabled, and the display for that channel shows the readings of two flowmeters installed in series.
14. Push Select:

Max Out Rate (Hz)  
0015

Max Out Rate is the maximum allowed rate of output pulses to the PLC/computer’s input. If the maximum is exceeded, then the drive to pump contactors stops, the ME2008 stored buffered memory sends the extra pulses to the PLC/Computer’s AC Yellow Optos (under the 15 Hz max. input rate) or to low scanrate systems. This safeguards against any overdoses which could occur if PLC does not capture all incoming pulses.

NOTE:
1. DO NOT SET THE MAX OUT RATE UNNECESSARILY HIGH, as this will affect the duty cycle of the pulses (i.e. will narrow the pulse width) which may make it difficult for the receiving PLC to detect the pulses.
2. Extra pulses received (above the allowed rate) represent actual extra volume measured by the flowmeter and ME2008, but which would have otherwise not been fully counted by the PLC/Computer system. (This situation is different to actual “inflight overflow”, where a DEDUCT value must be programmed in the computer system to stop the pump earlier).

IMPORTANT: PLC/Computers that accept AC input pulses via “Yellow” optos have a pulse input frequency limit of 15 Hz, so for the ME2008 to protect such systems and prevent overdose, set values in the ME2008:
* MAX OUT RATE to 15Hz or less for AC type; and
* OUTPUT (LITRES/PULSE) to a value so that, at your maximum operating flowrate, pulses to PLC/Computer will not exceed 15Hz.

Example: if the receiving PLC can only detect pulses at a rate up to 15 Hz, then set MAX OUT RATE to 15.

e.g. if your operating flowrate is 60 Litres/minute, and you set OUTPUT (LITRES/PULSE) = 0.100 (i.e. 100 mls/pulse), the ME2008 will output 10 pulses/second (i.e. < 10Hz) to the PLC/Computer well below the 15Hz. Max pulse rate.

15. Push Select:

MANU ELECTRONICS  
ME2008 V1.8

Returns to intro display.

Note: V1.9 software is for Water channel options

16. Push Reset:

000.000 000.000  
000.000 000.000

Returns to the Batch function. Display is in “LITRES” to 3 decimal places.

WARNING

Only after all products are batched, should totals be reset (does not affect accumulated totals).
All ME2000/2008 should be upgraded with the latest v1.8 software. Micro chips can be purchased & plugged-in.
Before you leave the plant, you must take a VOLUMETRIC calibration of quantity dispensed and cross-reference with ME2008 readings !!!

ALARM SAFETY STATUS

If any of the safety features are triggered, the relevant alarm will come on. The Display will indicate status of the channel that is in alarm condition (see message explanations on page 11). In this case, as a precaution the ME2008 will shut down pump drive of the faulty channel only, allowing for further examination of the problem.

SAFETY PROCEDURE IN EXAMINING THE PROBLEM

If the alarm comes on, DO NOT push RESET immediately - just push MUTE to silence alarm, then observe display and take note of batch readings and alarm message. Address the problem if possible.
WAIT for other channels to complete batch, then push RESET to be ready for the next batch.

ME2008 - SPECIFICATIONS

<table>
<thead>
<tr>
<th>Specification</th>
<th>Description</th>

Other Options

- V1.8 Software version with option to disable comparator function (each channel has 1 counter per flowmeter instead of 2)
- IR Independent Resets for each 2-channel module in the ME2008.
- USA USA units (non-metric) e.g. Gallons.

Spares

- HP-CAT5E 4-way external panel, for programming up to 4 dual modules (includes HP-CAT5E)
- HP Spare hand-held plug-in keypad programming module.
- HK Hinge Kit.

All other program parameters can be factory-entered or done via the plug-in programmer (see diagram above) onsite.

ME2008 - Technical Guide

Lightning and Power Supply to ME2008
- The Power Supply must come from the computer supply, which should have lightning arrestors already fitted to its Uninterruptable Power Supply (UPS).
- Fitting a 0.03 to 0.1µF 250vac capacitor on the pump contactor coil (between pump drive of ME2008 and Neutral), helps eliminate any voltage spikes (see page 11).

STARTS DRIVES
Computer starts have Black Optos which are usually solid state optos. When computer starts, the Optos stay on ("240vac energized") for the duration of the batch cycle and turn off at completion of the batch cycle. When the optos turn off, sometimes a higher than normal residual leakage voltage is maintained e.g. 90 vac (so installers/maintainers must measure, on the batching computer, the leakage voltage, when a batch is NOT in progress, between each black Opto's start 240v Active and Neutral). This voltage is sometimes enough to keep ON relays that drive contactors or solenoid coils. If this occurs, fit a 12kΩ 5W resistor between the Start Drive and Neutral connections (see page 11).

Pulse Output
In software version V1.7, the pulse output drive to the PLC optos is kept low when there are no output pulses, to help prevent noise. In V1.8, is as above, but also with ability to select a single counter for each flowmeter (so no need to bridge 1A and 1B, etc). Any units with software versions at 1.6 or earlier, should have their modules returned to ManuFlo to be upgraded to V1.7 or V1.8.

TROUBLESHOOTING - BACKFLOW
In some installations with standard MES flowmeters, the ME2008 may count without batching being in progress, causing a "Back Flow" alarm.
1. Usually, this is due to the Non-Return Valve not closing, thus allowing backflow which results in counts as the liquid runs back thru the flowmeter (PD types).
   Ensure that the Non-Return Valve is clean and operating correctly.
2. If Non-Return Valve is OK, then ensure that shielded cable is used. If cable is not shielded, then interference can be picked up and transmitted to the ME2008 which will interpret it as backflow.
3. If shielding is OK, then possible cause is vibration in plant near MES meters. Install flowmeters away from vibration causes, or anchor meters with rubber mounts.
4. If after batch complete and the shut off valve fails to close, then "backflow" alarm will engage.
5. If vibration is still prevalent, then using MES-R Reed Switch flowmeter pulseheads is recommended.
   - The MES-R pulsehead is GREEN in colour with a square junction box (2 wire connection) - this distinguishes them from the ordinary MES black/white round junction pulseheads.
   - See installation and programming instructions below, in particular that reprogramming of the ME2008 is required because an MES20-R 20mm size gives 61 pulses/Litre instead of 1000 pulses/Litre.

MES-R INSTALLATION and PROGRAMMING
A. Replace MES pulsehead with an MES-R pulsehead.
B. Wire "Shield" and "Pulse" connections only. This is a 2-wire connection only - DO NOT wire +12v into pulsehead.
C. Program the ME2008 Input Pulse to following factors:
   for MES20-R 20mm : 0061.00 pulses/Litre, for MES25-R 25mm : 0034.00 pulses/Litre. All other program factors remain unchanged.

NEW FEATURES:
- [New Feature Image]

To re-enable the modules showing "settings lost", proceed as follows:
- Plug the handheld Programmer into the Dual Channel Module.
- To restore the default settings (which are input calibration 1000 pulses/Litre, divided pulse output 50mips), push 2 buttons simultaneously on the Programmer, being either the 2 arrow buttons or the DOWN and UP buttons.
- Re-enter parameters (via the Programmer) and refer to program sheet settings.
1/ New AC power transformer allows new or modified units to operate with up to 8 admixtures running simultaneously without any effect to the unit’s performance.

2/ New MES-N pulseheads with new all solid state smart technology (frwd/rvrs flow) are vibration free and interchangeable.

ME2008 DISPENSER INTERFACE IN CASE OF ALARM WARNING:

- If any of the safety features are triggered, the alarm will sound.
- The Display will indicate message status condition of the channel that is in alarm condition, as a precaution the ME2008 will shut down pump drive of the faulty channel only, allowing further examination of the problem.
- DO NOT push RESET immediately - observe display and take note of the batch readings and the alarm message.
- WAIT for other channels to complete batch, then push RESET to be ready for the next batch.
- If batcher gets an Alarm again at batching, then:
  - MOVE THE TRUCK MIXER AWAY FROM THE LOADING POINT
    - stop using that chemical channel; as each attempt doses 2 seconds worth of chemical into the mix.
    - record the quantity displayed on the ME2008 and the batch computer; and ring your local admixture supplier for advise/service.

If in doubt, call your local installer / Admix Supplier or contact ManuFlo on phone +61 2 9938 1425 or +61 2 9905 4324.
